

FinanceFlow

A secure, responsive dashboard for accounts, transfers and reporting.

ROLE	TYPE	CATEGORY
Full-Stack Developer	Personal / portfolio project	Financial Services Dashboard

OVERVIEW

FinanceFlow is a responsive financial services dashboard for account balances, transaction history, transfers, and beneficiary management. It was built around secure authentication flows, idempotent transaction requests, defensive error handling, and an audit trail, so customers and support staff can trust every balance and transfer shown on screen.

KEY FEATURES

- Real-time account balance and transaction history views with drill-down detail
- Money transfer workflow with beneficiary management and confirmation steps
- Idempotent transaction requests to prevent duplicate transfers on retry or network failure
- Form validation and defensive error handling across every money-movement flow
- Audit event log for transfers and account changes to support compliance reviews
- API-driven reporting views for account activity, exportable for reconciliation

MY CONTRIBUTIONS

- Designed the React/TypeScript front end and the Next.js routing and data-fetching layer
- Built the Node.js REST API and PostgreSQL schema for accounts, transfers and audit events
- Implemented idempotency keys and validation on the transfer endpoints to protect data integrity
- Set up GitHub Actions for linting, automated tests and CI checks on every pull request

TECH STACK

React	TypeScript	Next.js	Node.js	PostgreSQL	Tailwind CSS	GitHub Actions

SKILLS DEMONSTRATED

- Secure authentication
- REST API design
- PostgreSQL schema design
- CI/CD
- Form validation
- Responsive UI
