

FleetFlow

A live operations dashboard for dispatch, field workers and tasks.

ROLE	TYPE	CATEGORY
Full-Stack Developer	Personal / portfolio project	Logistics & Field Operations

OVERVIEW

FleetFlow is an operations dashboard for dispatching work, tracking driver and field-worker activity, and monitoring task status in real time. Location updates and status changes stream over WebSockets so dispatchers always see current, not stale, field data.

KEY FEATURES

- Live dispatch board for assigning tasks to drivers and field workers
- Real-time location and status updates over WebSockets
- Task status tracking from assigned through in-progress to completed
- Operational reporting on completion rates and response times
- Map-oriented views for field-worker location and route context

MY CONTRIBUTIONS

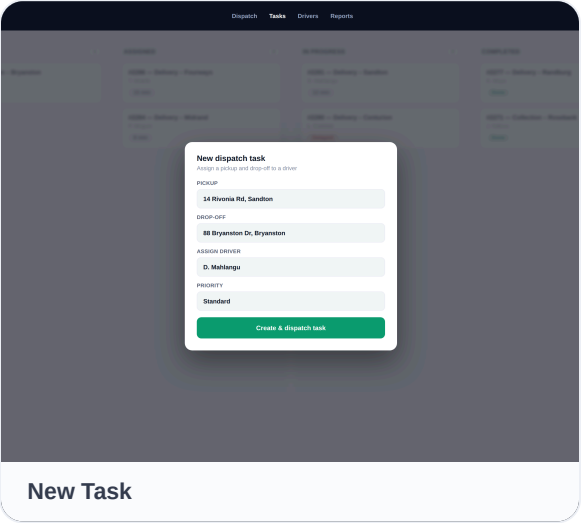

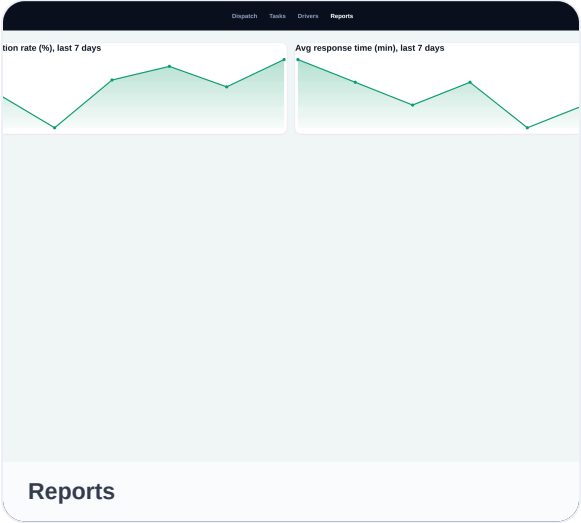

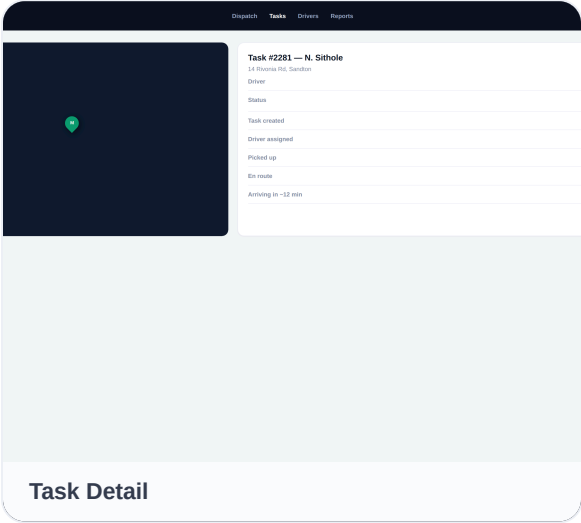

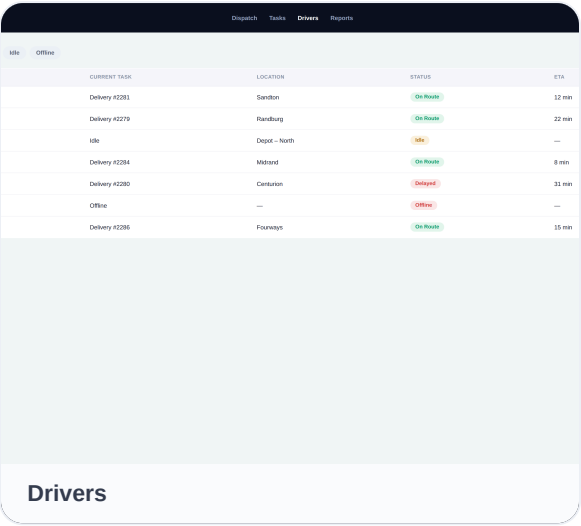

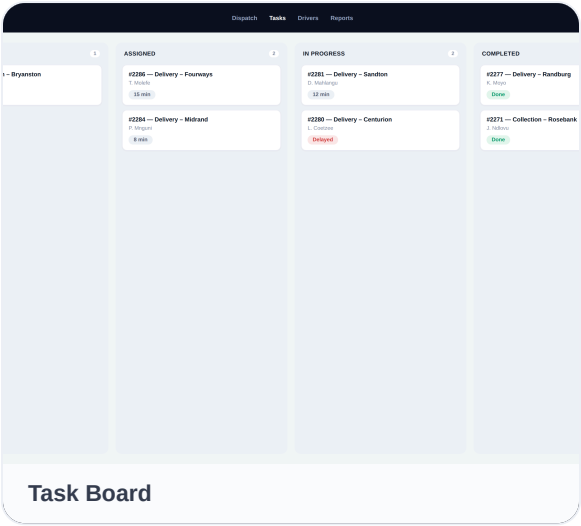

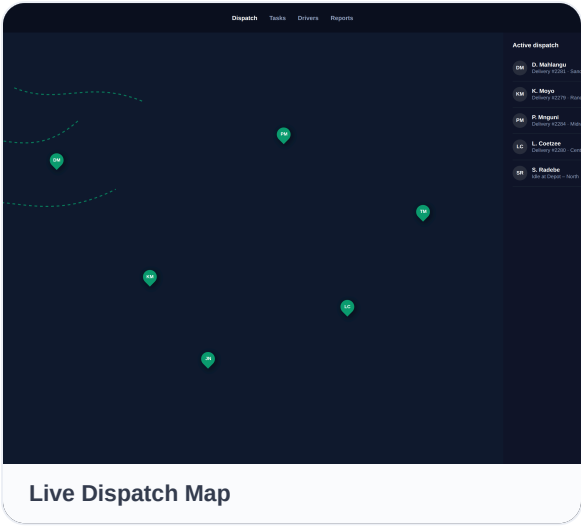

- Built the real-time dispatch UI in React/TypeScript with live WebSocket updates
- Designed the PostgreSQL schema for tasks, drivers and status history
- Implemented the Node.js WebSocket layer for location and status broadcast
- Deployed the service on AWS and set up monitoring for the real-time connections

TECH STACK

- React
- TypeScript
- Node.js
- PostgreSQL
- WebSockets
- AWS
