Dear Hiring Team,

I am excited to apply for a Full-Stack Software Engineer / Full-Stack Developer role on your team. With more than six years of hands-on experience designing, building, testing and scaling production web applications and SaaS products, I specialise in the modern JavaScript ecosystem – React, Next.js, TypeScript, Node.js and Express.js – and work confidently with PostgreSQL, MongoDB, REST APIs, AWS and real-time features. I deliver reliable, high-performance software from requirements through deployment, with a strong focus on clean architecture, testing and measurable business impact.

In my current role as Full-Stack Engineer at Gerko, I report directly to the CTO and mentor a team of three junior developers while leading end-to-end development of a multi-tenant healthcare Practice Management SaaS used by clinics for scheduling, patient records, billing and reviews. Key contributions include:

- **Performance optimisation:** Cut initial page load times by 35% through telemetry-driven Core Web Vitals analysis, improving SEO and user experience.
- **Scalable front-end architecture:** Designed and maintain a reusable React component library (Webpack, Jest) that increased development velocity by 20%.
- **Secure APIs and real-time sync:** Built high-throughput RESTful APIs and Node.js microservices supporting real-time data synchronisation across segregated patient databases.
- **Quality and testing:** Introduced automated component and integration testing that reduced production regressions by 15%.

Earlier, at Sasol, I delivered enterprise features in React, Next.js and TypeScript, integrated real-time field-worker tracking over WebSockets, reduced PostgreSQL query latency by 40% for high-volume reporting and contributed to 99.9% application uptime. At Tata Consultancy Services, I built React and React Native interfaces with Redux and REST APIs for financial-services clients, including work within strict compliance requirements.

Outside my employment, I designed and built the live Shopify store for Lwazi Hair, featuring a custom multi-step product builder, live pricing, Yoco payments and WhatsApp ordering. My portfolio at admire-portfolio.vercel.app presents case studies across healthcare, fintech, e-commerce, logistics, EdTech, PropTech and HR. I am also completing a BSc in Computer Science at IU International University of Applied Sciences and hold recent certifications in Next.js & Vercel and AWS.

I am motivated by challenging technical problems and by shipping software that users trust. Whether the priority is performance, scalability, developer experience or product velocity, I bring a pragmatic, ownership-driven approach and communicate clearly with both engineers and non-technical stakeholders. I would welcome the opportunity to discuss how I can contribute to your team's goals. My CV is attached for your review.

Sincerely,

Admire T. Ndaneta

Full-Stack Software Engineer
